Report lab 2

I implemented ChatGPT for simple question-answer implementation, and I mainly tried with singers. So I asked „What is x famous for?", whereas X is a singer. ChatGPT gave me therefore information on what the singer is famous for. In my case, it works well with modern singers, like Mika or Blink 182. I had problems with Britney Spears and Michael Jackson.

To be as simple as possible, I added only a greeting state (before GPT), and a state if the user wants to ask something more (after GPT) (there the user can decide if they want to say yes to knowing more, or no to having received enough information).

I put the max_tokens to 500, since I wanted to have longer answers.
